

AtliQ Sales Current Workflow Breakdown

To Be Workflow Breakdown

AI connects read-only directly to AtliQ's real systems — the team's email inbox, wherever meeting notes are kept, and the CRM itself.

New emails and notes get picked up automatically. Nobody manually feeds it anything; the dashboard just reflects reality.

What the actual prototype does :

it reads from file exports , the CRM as a CSV, emails and notes as text files
Refreshed when a human clicks "Run/Refresh analysis."

AI Capability Mapping

Information Extraction

Pulls structured facts - names, dates, commitments, deadlines (out of unstructured email/note text into a defined JSON schema).

Classification

Sorts each finding into a fixed category (Mismatch, Missing Info, Timing, Open Question, Deprioritize signal) and classifies timing as due-now vs. future urgency.

Generative AI (Text Generation)

Drafts new text grounded in real evidence: suggested follow-up emails, suggested next actions. Never sent automatically.

Summarization

Condenses the full pipeline's state, across all leads — into one short executive summary each run.

Explainability / Grounded Attribution

Every AI output must cite a verbatim quote from its source document.

Anything that can't be matched is automatically rejected before it's ever shown.

Rule-based (not AI)

Deterministic Matching

Exact/fuzzy matching on company name and contact email — catches duplicate CRM records and companies missing from the CRM entirely.

ETHICAL RISK MITIGATION CARDS

Governance

Launch requires validated examples to pass; any fabricated output triggers instant rollback.

Data & System Security

Data is protected and systems are secured against tampering or misuse.

Explainability, Transparency

Original source documents are always viewable, read-only, next to every finding.

Fairness

Scoring uses only business data — deal value, staleness — never personal or protected attributes.

Human Augmentation, Control

AI only suggests — every action needs a human's explicit approval to happen.

Privacy

No protected personal data enters the AI's context; all prototype data is synthetic.
